

Fail2Ban support

Z-Push has a configuration option called `LOGAUTHFAIL`, by default set to `false` (disabled).

To enable it, set this configuration parameter to `true`.

This will cause an additional log entry in `WARN` level that will be logged to `z-push-error.log`.

The log message looks like this:

```
IP: 123.123.123.123 failed to authenticate user 'user@domain.com'
```

For a `systemd` server, use:

```
# FILE : /etc/fail2ban/filter.d/z-push.conf
# Fail2Ban configuration file
[INCLUDES]
before = common.conf
[Definition]
# Option: failregex
# Notes.: regex to match the password failures messages in the logfile.
The
#         host must be matched by a group named "host". The tag "<HOST>"
can
#         be used for standard IP/hostname matching and is only an alias
for
#         (?:::f{4,6}:)?(?P<host>[\w\-\.\^_]+)
# Values: TEXT
#
failregex = IP: <HOST> failed to authenticate user
ignoreregex =
[Init]
journalmatch = _SYSTEMD_UNIT=fail2ban.service
```

No `systemd` server, remove these two lines:

```
[Init]
journalmatch = _SYSTEMD_UNIT=fail2ban.service
```

If using `ufw` as firewall:

```
# UFW file /etc/fail2ban/action.d/uw-all.conf
# Fail2Ban configuration file uw-all.conf
#
# We add the rules to uw for better control and management
#

[Definition]
actionstart =
actionstop =
actioncheck =
actionban = uw insert 1 deny from <ip> to any
actionunban = uw delete deny from <ip> to any
```

This is the actual configuration for fail2ban:

```
# Jail.local
[z-push]
enabled = true
port = http,https
filter = z-push
banaction = uw-all
# also enable define('LOGAUTHFAIL', true); in z-push/config.php or
/etc/z-push/z-push.conf.php
logpath = /var/log/z-push/z-push-error.log
maxretry = 3
bantime = 84600
```

The above configurations were contributed on 23.03.2016 by [thctlo](#) in the [forum](#). Thanks!
